Exercises Section 1.2

- 1.3 A Word about Comments
- 1.4 控制流
 - 1.4.1 The while Statement

Exercist Section 1.4.1

- 1.42 The for Statement
- 1.4.3 Reading an Unknown Number of Inputs
- 1.4.4 The if Statement

Chapter 1. Getting Started

1.1 Writing a Simple C++ Program

Function

- define: ReturnType Function-Name (Parameter-List) {Body}
- main-function:int_cdecl main (int argc¹,char *argv[]², char *argv[]³) {return 0x0;}

Type

- define: the contents of a data element, operation that are on those data
- say: \mathbf{v} has type $\mathbf{T}^{\underline{4}}$

1.1.1 Compiling and Executing Our Program

Compile

• depend: operating system and compiler

1.2 A First Look at Input/Output

10

- define: Input and Output
- C++ IO: not statement but standard library
- stream: a sequence of characters
- iostream:<istream> and <ostream>

Standard IO Objects

- such that: cin \ cout \ cerr \ clog
- cin: standard input and has type istream
- cout: standard output and has type ostream
- cerr: standard error and has type ostream
- clog: information about the execution of the program

associate

- do-what: opearating system associate the window with Standard IO Objects
- So, when we read from cin, data are read from the window in which the program is executing, and when we write to cout, cerr, or clog, the output is written to the same window.

A Program That Uses the IO Library

Writing to a stream

- operator << :
 - *two operands* : **left-hand** operand must be an **ostream** object; the **right-hand** operand is a **value to print**.
 - the result: the ostream on which we wrote the given value. (left-hand)*
- mainpulator:
 - o such that: std::endl
 - endl: ending the current line and flushing the buffer(associated with that device)

using Names from the Standard Library

namespace

• std-namesapce: include all the names defined by the standard library

Reading from a Stream

- operator >>:
 - two operands: left-hand operand is an **istream object**; the right-hand operand is **object**.
 - o the result: left-hand

Exercises Section 1.2

Exercise 1.3: Write a program to print Hello, World on the standard output.

Answer

```
#include <iostream> // using IO standard library
int main(int argc,char *argv[],char *envp[])
{
    std:: cout << "Hello,World" << std:: endl;
    // std::cout << "Hello" <<"," << "World" << std::endl;
    return 0x0;
}</pre>
```

Exercise 1.4: Our program used the addition operator, +, to add two numbers. Write a program that uses the multiplication operator, *, to print the product instead.

Answer

```
#include <iostream> // using IO standard library
int main(int argc,char *argv[],char *envp[])
{
    std::cout << "Enter two numbers" << std:: endl;
    int v1,v2;
    std::cin >>v1 >> v2;
    std::cout <<"The multiplication of "<< v1 << "and" << v2 << "is"<<v1*v2<<std::endl;
    return 0x0;
}</pre>
```

Exercise 1.5: We wrote the output in one large statement. Rewrite the program to use a separate statement to print each operand.

Answer

```
#include <iostream> // using IO standard library
int main(int argc,char *argv[],char *envp[])
{
    std::cout << "Enter two numbers" << std:: endl;
    int v1,v2;
    std::cin >>v1 >> v2;
    std::cout << " The Multiplication of";
    std::cout << v1;
    std::cout << "and";
    std::cout << v2;
    std::cout << "is";
    std::cout << v1 * v2;
    return 0x0;
}</pre>
```

1.3 A Word about Comments

Comments

- warning: the compiler ignores comments (no effect on program)
- use: help the human readers of our program.
- such that: /* comments */ and // comments
- *important:* comments pairs do not nest⁷

1.4 控制流

Statement

- execute sequentially: from top to buttom
- *flow-of-control statements:* allow for **more** complicated **execution paths**.

1.4.1 The while Statement

```
#include <iostream>
/*

* sum the numbers form 1 through 10

*/
int main(int argc,char *argv[],char *envp[])
{
   int sum = 0,val = 1;
   while(val <= 10){
      sum += val;
      ++val;
   }
   return 0x0;
}</pre>
```

• define: **while**(condition) {statement}

Exercist Section 1.4.1

Exercise 1.9: Write a program that uses a while to sum the numbers from 50 to 100.

Answer

```
#include <iostream>
int main(int argc,char *argv[],char *envp[])
{
    int sum = 0,val =50;
    while(val < 101)
    {
        sum += val;
        val++;
    }
    return 0x0;
}</pre>
```

Exercise 1.10: In addition to the ++ operator that adds 1 to its operand, there is a decrement operator (--) that subtracts 1. Use the decrement operator to write a while that prints the numbers from ten down to zero.

Answer

```
#include <iostream>
int main(int argc,char *argv[],char *envp[])
{
    int val =10;
    while(val >= 0)
    {
        std::cout << val << std::endl;
        val--;
    }
    return 0x0;
}</pre>
```

Exercise 1.11: Write a program that prompts the user for two integers. Print each number in the range specified by those two integers.

Answer

```
#include <iostream>
int main(int argc,char *argv[],char *envp[])
{
    int min = 0,max = 0;
    std::cout << "Enter two number,min and max:"<<std::endl;
    std::cout << "Enter the min:";
    std::cin >> min;
    std::cout << "Entet the max";
    std::cin >> max;
    while(min != max)
    {
        std::cout << min << std::endl;
        min++;
    }
    return 0x0;
}</pre>
```

1.42 The for Statement

```
#include <iostream>
/*

* sum sum the numbers form 1 through 10

*/
int main(int argc,char *argv[],char *envp[])
{
   int sum = 0;
   for(int val = 1;val <= 10; ++val)
   {
      sum += val;
   }
   return 0x0;
}</pre>
```

1.4.3 Reading an Unknown Number of Inputs

```
#include <iostream>
/*

* read until end-of-file,calculating a returnning total of all values read
*/
int main(int argc,char *argv[],char *envp[])
{
   int sum = 0,val = 0;
   while(std::cin >> val)
      sum += val;
   std::cout << "The sum of all numbers is:" << sum << std::endl;
   return 0x0;
}</pre>
```

condition: cin

- warning: When we use an istream as a condition, the effect is to test the state of the stream.
- *end:* when we hit **end-of-file**(Ctrl + Z or Ctrl + D) or encounter an **invalid input**, *such as* reading a value that is not an integer.

1.4.4 The if Statement

```
#include <iostream>
/*
    count how many consecutive times each distinct value appears in the input
    such that: 1 1 1 2 2 2 3 3 3 4 5 5
*/
int main(int argc,char *argv[],char *envp[])
    int currVal = 0;
    if(std::cin >> currVal)
        int count = 1;
        int val = 0;
        while(std::cin >> val)
             if(val == currVal)
             count++;
            else
              std::cout << currVal << "occurs " << count <<" times"<< std::endl;</pre>
              currVal = val; // reset pre-value
              count = 1;  // reset count
            }
        std::cout << currVal << "occurs " << count <<" times"<< std::endl;</pre>
    }
    return 0x0;
}
```

```
1. 命令行参数的数量(arg count) <u>e</u>
2. 命令行参数数组<u>e</u>
3. 环境参数数组<u>e</u>
4. 如果一个名为v的变量的类型是T,我们称"v具有类型T"<u>e</u>
5. C++没有提供输入输出语句,而是用标准库来实现IO<u>e</u>
6. 换行,并且将与设备关联的缓冲区内容刷新到设备中,保证所有输出都写入到了输出流中,而不是停留在内存中等待写入流。<u>e</u>
7. 注释界定符不能够嵌套<u>e</u>
```
